*Mohammed Rahmatullah: rahamatm@hotmail.com

*Calotropis procera* R.Br. is a spreading shrub or a small tree native to southern Asia and North Africa. In English the plant is known as ‘Sodom’s apple milkweed’ and in Bengali as ‘akondo’. Most often the plant can be found growing by the road-sides or in the wild. It is a highly regarded medicinal plant and used for multiple therapeutic uses by both folk medicinal practitioners (FMPs) and tribal medicinal practitioners (TMPs) of Bangladesh. The various ethnomedicinal uses of *Calotropis procera* R.Br. in Bangladesh are shown in Table 1.

A novel ethnomedicinal use of stems of *Calotropis procera* R.Br. (Figure 1) was brought to our attention from a FMP in Kanchanpur village in Noagaon district, Bangladesh. The FMP advised to take dry stem of the plant, light them and inhale the smoke like as it is done for cigarettes. This was to be done twice daily, and the FMP claimed that this mode of treatment cures tuberculosis. Although the plant is very common in Bangladesh, plant specimen as shown by the FMP was collected and identified at the Bangladesh National Herbarium (Accession Number 43,900). Tuberculosis is prevalent in Bangladesh (Barman et al., 2017). What is more serious is that multi-drug resistant tuberculosis is
reportedly present in overall 7% tuberculosis patients, 1.4% in new and 28.5% in previously treated patients (Banu et al., 2017). It is expected that Calotropis procera R.Br. may present new opportunities towards treatment of tuberculosis.
